Postgre/PostGIS Tutorial

Gathering and Adding Data

University of Colorado Denver

Created by: Ricardo Oliveira *ricardo.oliveira@ucdenver.edu*

9

On this second tutorial we will be covering the basic steps for gather real world data and load it into a database.

Adding Data.

For this tutorial we will be using free data from the City and County of Denver.

Census Neighborhood Demographics (2010)

Last updated 4/24/2013

Resources

Based upon the Neighborhoods layer from Community Planning and Development. This layer is a duplicate of that layer, but with additional demographic information compiled from the 2010 US Census. Although every effort was made to ensure that blocks were assigned to their proper neighborhoods, due to geographic problems inherent in the original 2010 census block data, errors may exist. This data-set includes the housing and population data from redistricting file P.L. 94-171 of the 2010 census. The data-set does not contain data for any enclaves administered by other jurisdictions that are located within the City and County of Denver's boundary.

Version	1.0.2			

At the <u>http://data.denvergov.org/</u> we will download a simple shapefile for the neighborhoods of Denver.

Search for Neighborhood at the search box and download the shp file for Census Neighborhood Demographics (2010). Extract the data and save in a place with easy access.

Now that we have our data let's take a look at the PostgreSQL. Open the pgAdmin III program, this is our command center to work with all databases.

This is how the screen looks like for the first time we open pgAdmin. pgAdmin is the Graphical User Interface (GUI) that allow us to manipulate postgresSQL without the need to input our commands into a written only terminal. On the left side there is a navigation box, since we are not working with multiple database servers we have only one connection here, double click it. Explore a little the directories, don't worry for now what each category means. The two main tools that we have to be familiarized here are the SQL builder and the PostGIS importer.

PostGIS importer.

Now let's create a new database for our Denver data.

Double click the Databases category and select New Database...

		1	New Data	abase		>
Properties	Definition	Variables	Privileges	Security Labels	SQL	
Name						
OID						
Owner						*
						^
Comment						
						~
Help					OK	Cancel

Call it Denver, choose *postgres* as owner and press OK.

Now we have to load the PostGIS extension inside this database. Open the SQL query builder.

	-	uery Builder		R	Scratch pad	Denver on po	sigres@io
revious queries		✓ Delete	e Del	ete All			
create	extensio	n postgis;					
<				>	<		>
utput pane							
Data Output	Explain	Messages	History				

Type: create extension postgis; and press execute query or f5.

Now using the PostGIS Importer let's load the Denver neighborhood shapefile into our new database. Open the PostGIS importer and load the

census_neighborhood_demographics.shp file into the importer.

	PostGIS Shapefile	Import/Export Manager		•	
ostGIS Connection

FAQ: But what is a SRID?

SRID stands for Spatial Reference Identifier, it is a single code that compiles all the information about the data's geographic coordinate system and projection.

More information can be found at: <u>http://en.wikipedia.org/wiki/SRID</u>

Even though there are more than 3000 codes you don't need to know every single of them. For our Denver data we have to do some investigation. Open the .prj file in a word pad.

Here we have all the required information to have or data projected. One easy way to figure out which SRID code refers to this system is to copy all this data e paste into the <u>http://prj2epsg.org/search</u> website.

Prj2EPSG	🛞 Open Geo
Prj2EPSG is a simple service for converting well-knowr information from .prj files into standard EPSG codes.	n text projection
Paste a WKT definition or type keywords below:	
GEOGCS["GCS_WGS_1984",DATUM["D_WGS_1984",SPHEROID["W 23563]],PRIMEM["Greenwich",0.0],UNIT["Degree",0.01745329251994	
or upload a .prj file: Choose File No file chosen	
Results	
Found a single exact match for the specified search terms:	
 4326 - GCS_WGS_1984 	

Now we know that code 4326 refers to GCS_WGS_1994. Let's plug this number in the PostGIS importer.

<u></u>	PostGIS Shap	efile Impo	ort/Export Manager			_ □	×
PostGIS Connection							
	Vi	ew connectio	n details				
Import Export							
_Import List							
Shapefile	Schema				SRID Mode		
C:\Users\Ricardo\Documents\PostGIS	\Denver\census_nei public	census_neig	ghborhood_demographics_2010	geom	4326 Create		
		Add Fi	e				
Options	Import		About		Cance		
Log Window-							
L							~

You may have notice that this data is in fact unprojected data, in order to work if it geometries we will have to reproject it, this procedure will be covered on the fifth tutorial of this series.

Now you're ready to import your first data into the database. If you want to import several data at the same just keep adding new data and updating their SRID. Press Import.

Congratulations, your first data is already inside your first database!

(More data will be add on the third tutorial.)
